Efficiency Offerings for Manufacturers

Whether you're operating a small manufacturing site or a large industrial facility, the Nicor Gas Energy Efficiency Program offers tailored solutions to help you reduce energy use and lower costs. We have a variety of ways you can save.

Start with an assessment

An energy advisor will conduct an on-site assessment of your facility to identify opportunities for energy efficiency improvements. Following the evaluation, you will receive a customized report outlining recommended projects and applicable rebate options.

Get money for your upgrades

We have a variety of equipment and service-related rebates including space heating, steam traps, boiler tune-ups and other efficiency improvements. Are you thinking about a project that's not on our list? Our custom incentives may cover it! If you have any questions about our rebates or incentives our team is here to help.

Common manufacturing savings opportunities

Some of our top energy-saving improvements that we recommend for our manufacturing customers include:

- Pipe insulation
- Condensate return
- Steam trap survey and replacement
- Compressed air heat recovery
- Building automation systems
- Combined heat and power (CHP)
- High-efficiency boilers/furnaces
- Rooftop units (RTU)

Let efficiency fuel your momentum

Go the extra mile by incorporating energy efficiency into your sustainability and operational goals. By joining our Strategic Energy Management cohort, organizations receive coaching and workshops to guide them to higher savings and long-term partnerships to reach their savings goals.

We want to help you take the next step to save.
